Summary

Backend engineer with nearly 3 years of production experience in Python (Django, DRF, FastAPI), PostgreSQL, Redis and AWS. At TravLounge I work on payments, background jobs, real-time notifications and deployment, and recently took the API from a ceiling of ∼15 to 250 requests per second.

Experience

Backend Engineer Aug 2025 – Present

TravLounge (Beacon Infotech) — sleeping pods, car wash, food and subscriptions for travellers

- Raised API throughput from ∼15 to **250 req/s**. A production load test showed Gunicorn sync workers capping each ECS task while CPU sat at 37%, so CPU-based autoscaling never fired. Fixed it with threaded workers, N+1 query fixes, per-user Redis caching and a database move closer to the app servers.
- Built Razorpay payments for four product lines behind one handler registry: HMAC-verified webhooks, idempotent confirmation, Route payouts to vendors, and automatic refunds when two customers pay for the same pod at once.
- Added a reconciliation job that asks Razorpay about payments captured but never confirmed (missed webhooks), cutting worst-case recovery from ∼30 to ∼12 minutes.
- Moved post-payment work off the request path into 13 Celery task types (invoice PDFs to S3, WhatsApp, FCM and email, timed reminders), with Redis idempotency keys so retried tasks never send a duplicate message.
- Built WebSocket notifications on Django Channels and Daphne with JWT-authenticated connections, running as its own ECS service and handling 100+ concurrent connections.
- Set up Docker → ECR → ECS Fargate deploys through GitHub Actions with staged releases and approval gates, plus monitoring (Prometheus, Grafana, OpenTelemetry) and a 2,500+ test pytest suite in CI.
- Built location-aware listing search on Elasticsearch (GeoPoint, distance sorting), signal-invalidated Redis caching for the home feed, and an OpenAI function-calling trip planner that finds TravLounge stops along a route.

Python Developer Nov 2023 – Aug 2025

Marlo Technologies — maritime voyage management platform

- Built FastAPI and PostgreSQL services for voyage planning, vessel tracking and voyage mapping.
- Built the contract, estimate and transaction modules, with payments through Airwallex, and used Hasura event triggers to automate steps the operations team did by hand.
- Built credit-score computation and vessel valuation for the platform's financing features, plus voyage summaries and operational dashboards.

Project

jobscarp — personal project github.com/naveensheejachacko/jobscarp

- Turns job-alert emails into a scored, deduplicated review queue (FastAPI, SQLAlchemy, PostgreSQL, Gmail and Sheets APIs). The match score is a deterministic weighted formula; the LLM only writes the explanation, so scoring stays testable. 80+ tests.

Skills

Languages: Python, SQL, JavaScript, Bash
Backend: Django, Django REST Framework, FastAPI, Django Channels, Celery, Pydantic, Hasura
Data: PostgreSQL, Redis, Elasticsearch, MongoDB, Firestore
Cloud & DevOps: AWS (ECS Fargate, ECR, EC2, S3, IAM), Docker, GitHub Actions
Integrations: Razorpay, Airwallex, Firebase FCM, WhatsApp Business API, MSG91, OpenAI API
Testing & Monitoring: pytest, k6, Prometheus, Grafana, OpenTelemetry

Education

Python Full Stack Development, Brototype, Kochi Sep 2022 – Sep 2023

B.Tech Mechanical Engineering, APJ Abdul Kalam Technological University 2022

CGPA: 7.57
